Short Writeup

I feel that this app looks simple but is something that I have found very hard to create. When I initially started to do this assignment, I did not even know if I could complete it as it just seemed so hard. For me, the learning curve was very steep. Trying to follow along through guides and understanding what was going on was tough. I initially had many features planned for the app, but as I went about googling for information and searching for videos, I realised the difficulty of the task was much greater than I expected. In the end, I had to cut back certain functionalities due to time concerns and the difficulty level of some of the features. And I felt that I could have done better with better time management and more diligence. But even with the current limited functionalities, I still feel happy to have completed something. The process of learning was difficult, but the ending is a joyful one.

User manual:

Run db:create, then db:migrate, db:seed, bundle install, npm install to use the app.

In this app, you can create to-do item, and delete to-do item. You can add comments for each to-do item, so that you can know more info about it (eg add comment about the due date).

To view the comment of each task, simply press view task button

To go to home, press the home button while in the view task page

Note:

There is a need to refresh the page(press view task button and then the home button/ click the go back and go forward icon in the browser) to reload the newly created/destroyed task/comment .
